

Task 1 MATH 4610

Hyrum Hansen

September 1, 2021

1. Meeting completed on September 1st.
2. Account created. Can be accessed via <https://github.com/HyrumHansen>
3. Cygwin setup completed.
4. Repository cloned.
5. Version control reflection:
 - (a) Version control systems are collaborative tools that allow teams to make individual changes to code repositories. Generally there are branches, which is to say that one version of the repository may be in deployment while several others are being tested. When the testing repository is considered safe for launch it can merge with the master branch. VCS also tracks all changes made to the repository meaning that if your code breaks the program, you can simply revert to the old version.
